

Sustiqon OS

A sustainability-monitoring dashboard for a joinery (woodworking) workshop.

Hållbarhetskväll Hackathon

React + TypeScript

Sustainability / IoT

Sustiqon OS gives a small manufacturing workshop a single "operating system" view of its environmental impact. It turns raw shop-floor sensor data into clear impact metrics, measurable goals, and team gamification — making sustainability something a workshop can track and act on day to day.

Impact at a glance

124

TREES SAVED

38 L

PAINT WASTE CUT

1.2 t

MATERIALS RECYCLED

890 kWh

ENERGY SAVED

Key features

Connected IoT sensors. Live readings for paint usage, wood dust (PM2.5), humidity, noise, and energy draw.

Team gamification. Streaks, milestone progress, and earnable badges drive behavior change.

Inventory. Materials inventory table for the workshop.

Air quality monitoring. Real-time workshop air-quality tracking.

Goals. VOC-reduction, zero-paint-waste days, and renewable-energy targets with progress + deadlines.

Digital Product Passport. Dedicated DPP section aligned with EU traceability requirements.

How it's built

Frontend: React 18 · Vite · TypeScript · **Styling:** Tailwind CSS · custom earth-tone theme · **UI:** shadcn/ui (Radix) · **Data viz:** Recharts

State / routing: TanStack Query · React Router · **Testing:** Vitest · Testing Library · Playwright · **Prototyped on:** Lovable.dev

Status

Hackathon prototype — the dashboard UI is fully built; displayed figures are representative sample data demonstrating the intended product experience.
